```

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

RESULT 1
AARJON 2
AATJON AATJO

Thermotoga neapolitana strain DSM 5068.

/\*tag= a

Location/Qualifiers

thermostable enzyme; ss.

DNA polymerase; Tne; DNA sequencing; amplification;

The DNA polymerase C-terminal region DNA.

15-AUG-1996 (first entry)

AAT30049;

AAT30049 standard; DNA; 694 BP.

Tha polymerase is a thermostable enzyme suitable for use in DNA sequencing and amplification reactions. It can be obtd. by obtd. from transformed host cells, e.g. E. coli, carrying the DNA polymerase gene. Mutants having improved enzymatic properties may be produced (see also AAR98144-47).

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           A DNA sequence (AAT60031) encodes the C-terminal region, including the O-helix, of the Thermotoga neapolitana (Tne) DNA polymerase. It was obtd. from a genomic DNA expression library by screening E. coli transformants for thermostable DNA polymerase activity. When the sequence is translated it does not produce the entire amino acid sequence of Tne polymerase due to frameshift errors generated during sequence if Tne polymerase due to frameshift errors generated during sequenceing. However, an amino acid sequence was obtd. by translating all 3 reading frames (AAM13862-64), comparing these with known sequences, and splicing the Tne sequence together to form the sequence given in AAM13863. A complete coding sequence for Tne
                                       06-SEP-1996;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          T. neapolitana Tne polymerase C-terminal cDNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Sequence 694 BP; 230 A; 136 C; 178 G; 150 T; 0 other;

The DNA construct was obtd. by restriction digestion of pM284-derived DNA (see also AAT58135). When expressed in E. coli, The M284 delB showed no detectable polymerase activity.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            A DNA sequence (AAV58155) encodes deletion mutant The M284 delB (AAW11525) of the DNA polymerase (see also AAW11513) of Thermott neapolitana. The deletion mutant lacks the N-terminal 283 amino acids from the 5' exonuclease domain of the native enzyme
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                31-MAY-1996;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    of the DNA polymerase (see also AAWI1513) of Thermotoga neapolitana. The M316 has an artificially created methion and at mino acid position 316 as the initiator methionine. It was created by introducing a Met residue at position 316 (and a corresponding NCOI site) via site-directed mutagenesis of the native The gene (see also AATS8134). When expressed in E. coli from a T7 or tro
                       A DNA sequence (AAT58135) in plasmid pM284 codes for modified DNA polymerase The M284 (AAW11514) in which amino acids 1-283 of the native Thermotoga neapoiltana enzyme (see also AAW11513) are deleted and the naturally occurring Met-284 residue becomes the initiating methionine. It was obtd. by restriction digestion of the native gene (AAT58134). The deleteion results in elimination of 5' exonuclease activity. Further modification of the DNA in pM284
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                1276 CTTTCTGTGAGACTTGGAATACCGGTTAAAGAA 1308

                                               A DNA sequence (AAT58136) codes for mutant thermostable DNA polymerase The M284(D323E) (AAW1515) in which amino acids 1.283 of the native Thermotoga neapolitana enzyme (see also AAM15813) are deleted and amino acid residue 323 (Asp) of native The is substd. by Glu. It was obtd. by site-directed mutagenesis of pM284 DNA (see also AAT58135). The mutated gene can be incorporated into a vector and used for prodn. of The M284(D323E) in transformed host cells. The mutant enzyme has no significant 5' or 3' exonuclease activity and
e.g. PCR.
                                                                                                                                                                                                                                                                                          Claim 20; Page 138-140; 200pp; English.

                              A DNA sequence (AAT58137) codes for mutant thermostable DNA polymerase The M284(B325D) (AAWI1516) in which amino acids 1-283 of the native Thermotoga neapolitana enzyme (see also AAWI1513) are deleted and amino acid residue 325 (Glu) of native Tne is substd. by Asp. It was obtd. by site-directed mutagenesis of pM284 DNA (see also AAV58135). The mutated gene can be incorporated into a vector and used for prodn. of Tne M284(B325D) in transformed host cells. The mutant enzyme has no significant 5' or 3' exonuclease activity and is sultable for use in DNA sequencing and amplification reactions,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   RESULT 14
                                                                                                                                                                   A DNA sequence (AAT58142) codes for mutant thermostable DNA polymerase Tne MS84(D323E,D389A) (AAW1521) in which amino acids 1-283 of the native Thermotoga neapolitana enzyme (see also AAW1513) are deleted and amino acid residue 323 (Asp) of native Tne is substd. by Ala, and Asp-389 by Ala. It was obtd. by site-directed mutagenesis of pM284 DNA (see also AAT58135). The mutated gene can be incorporated into a vector and used for prodn. of the triple mutant in transformed host cells. The triple mutant has no significant 5' or 3' exonuclease activity and a half-life at 97.5 deg C of 22 min compared with 5 min for native Tne and 8 min for native Taq. It is suitable for use in DNA sequencing and amplification reactions,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      31-MAY-1996;
